

NoMans Combi — Manager Guide

A one-page cheat sheet for running the shuttle. You manage everything from your phone or laptop — no app to install, nothing to redeploy.

Live site: <https://nomansdrive.com>

There are three screens. A bar at the top of every page lets you switch between them: **Passenger** · **Driver** · **Admin**. You'll mostly live in the **Admin** (Manager) screen.

Screen	Who opens it	Address
Passenger	Guests	nomansdrive.com
Driver	On-shift drivers	nomansdrive.com/driver
Admin	You	nomansdrive.com/admin

1. Logging in

Open nomansdrive.com/admin and enter the **manager password**:

■ **Rumrunner2026**

It's saved on your phone after the first login, so you normally won't retype it. (Managers added later get their own personal code that looks like MGR-XXXXXX, and can also scan a QR code to log straight in.)

Keep this password private — anyone with it can change settings.

2. Opening & closing the combi (the daily routine)

At the top of the Admin screen is **Service status**.

- **Go online** — guests can now request rides. Tap it at the start of service.
- **Take offline** — guests see "the combi is off duty" and can't ping. Tap it at the end of the night.

If you've set **Service hours**, the combi flips online/offline on its own during that window — the button is just a manual override.

Each shift, before guests start pinging: 1. Tap **Go online**. 2. Make sure at least one driver is **on shift** (Drivers section — see below). 3. Confirm **Push alerts** are on, and that each driver has tapped **Enable phone alerts** on their own phone. 4. Tap **Send test push** to confirm alerts land.

3. Drivers

Driver alerts are **phone push notifications** — **no texts**. Each driver enables them once on their own phone (see below).

In the **Drivers** section you can:

- **Add a driver** — type their name + mobile number, save. The app generates a private login code (NM-XXXXXX) and a QR code for them. (The phone number is used so the *guest* can call the driver — alerts themselves are push.)
- **Send them their code/QR** — they open nomansdrive.com/driver and enter it (or scan the QR). It stays logged in on their phone. (A wrong or retired code is now **rejected with "not recognized"** instead of half-logging them in.)
- **They pick their van** — right after the code, the driver taps ■ **Van 1** or ■ **Van 2** (the van they're physically in). This is how two phones stay separate, and it drives who gets pinged first (see §3a). Their pick is remembered; they can **Switch van** anytime from the status card.
- **Driver enables push** — on /driver they tap **"Enable phone alerts."** On an iPhone they must first tap Share → **Add to Home Screen**, then open the combi from that home-screen icon, then Enable. (Android: just tap Enable.)
- **On shift / off shift** — flip a driver on at the start of their shift. On-shift drivers are the **fallback** who get pinged when no van has alerts enabled (see §3a). You control this here from Admin; the driver's own screen now shows **Switch van** in place of a self shift toggle.
- **■ alerts on tag** — shows next to a driver who's on-shift while push alerts are enabled. (It means the system will try to push them; they still need to have tapped "Enable phone alerts" on their device.)
- **Revoke** — removes a driver's code so they can no longer log in.

3a. How a new ride is routed (Van 1 first)

When a guest pings, the app picks who to alert in this order:

1. **Van 1** — if its phone has alerts enabled and it isn't already on a ride.
2. **Van 2** — if Van 1 is busy (or off), Van 2 gets it.
3. **Both** — if both vans are busy, both are pinged so whoever frees up first grabs it.
4. **On-shift drivers** — if *no* van has alerts enabled, it falls back to any driver you've flipped **on shift**.

A van counts as "in service" the moment that phone taps **Enable phone alerts** — so at open, make sure each van's phone has alerts on.

4. What the driver sees (so you can coach them)

When a guest pings, the alerted van/driver gets a **push notification (sound + vibrate) even with the page closed**, plus a chime + screen flash if /driver is open. Each request is a card with the guest's name, party size, any note, and **how far the pickup is from the driver** (e.g. "■ 0.4 mi away" / "right here") so they can judge accept vs. decline at a glance. The **newest ping is highlighted and badged ■ NEW** at the top of the queue. On a card the driver can:

- **■ View on map** — peek at where an unclaimed pickup is *without* claiming it.
- **■ Accept & navigate** — claims the ride first, and **only opens Google Maps if the claim wins** (so if two drivers tap at once, the one who didn't get it isn't sent driving to someone else's pickup). The guest immediately sees "[driver] is on the way" along with the driver's name and a **Call driver** button.

- **■ Call / ■ Text the guest** — one tap (phone is required when guests ping, so there's always a number).
- **Mark en route** → **Picked up** → **Dropped off** — optional step-by-step status.
- **✓ Finished** — **clear** — one tap to close the whole ride and clear it from the queue. The guest sees "You've arrived ■."
- **Decline / Pass to another driver** — the driver picks a reason (**Too far away** · **Too busy** · **Busy area** · **Done for the day**). The ride leaves *their* queue and is **pushed to the next available driver**. "Done for the day" also flips that driver **off shift**. If every available driver passes, the ride is cancelled and the guest is told to ping again. (Reasons show in **Today's rides** so you can see why a ride bounced.)

Only one driver can hold a ride at a time — once claimed, other drivers see it locked.

5. What the guest sees

1. Opens nomansdrive.com, allows location.
2. Picks **To NoMans** or **From NoMans**, enters **name + phone** (both required), party size, optional note.
3. Taps to request → gets a live **ETA card** and watches the van move on a map (the map stays zoomed to Oak Bluffs).
4. Once a driver accepts, the card shows the **driver's name + a Call driver button**.
5. If their driver **passes the ride** to someone else, the card shows "*Finding you another driver...*" instead of looking like it glitched back to the queue. Their queue number counts only the rides ahead that **no driver has picked up yet**.
6. They can **close the page and come back** — their ride status/ETA is remembered on their phone and reloads automatically.
7. They can **cancel** themselves any time before they're picked up.

Guests outside the Oak Bluffs service area are told they're out of range.

6. Keeping an eye on things

- **Top counters** — On board now · Stops today · Last GPS fix.
- **Today's rides** — a running log of every request today (live + completed), including any **decline reasons** (e.g. "■ Mike: too far away").
- **Live GPS (Bouncie)** — confirms the van's tracker is reporting in.
- **Send test push** — sends a test notification to on-shift drivers who've enabled alerts, so you can confirm push works before service.
- **Driver chime test** — plays the new-ride sound so a driver can confirm their phone volume is up.

7. Settings you can change anytime

Setting	What it does
---------	--------------

NoMans pin	The restaurant's exact location (pickup/dropoff anchor + map center).
Service area	The box guests must be inside to request a ride. Has a one-tap " Reset to Oak Bluffs " button that fills + saves the full-town box.
Capacity	Total seats available across the fleet.
Vehicles	Name your vans (e.g. "Van 1", "Van 2") — the labels drivers pick at sign-in and that show on the map.
Service hours	Auto online/offline window (Eastern time).
Push alerts	Turn driver push notifications on/off.
Managers	Add or revoke other managers.

Changes save instantly and take effect everywhere — no redeploy.

8. Quick troubleshooting

Problem	Check
Guests can't request a ride	Is it online ? Are they inside the service area ? (Tap Reset to Oak Bluffs if the box looks wrong.)
Driver code says "not recognized"	The code is wrong or was revoked — re-send the current NM- code/QR from Drivers .
Driver isn't getting requests	Did they pick a van and tap Enable phone alerts (iPhone: Add to Home Screen first)? New rides go to Van 1 first — if Van 1's phone has alerts on, Van 2 only gets pinged when Van 1 is busy. With no van's alerts on, only on-shift drivers are pinged.
No push alerts	Push alerts on + the van/driver tapped Enable phone alerts (on-shift drivers are the fallback when no van has alerts on). Use Send test push .
Driver hears no chime	Have them tap Unlock on their screen once (phones need a tap before they'll play sound), and use Driver chime test .

Van not on the map

Check **Live GPS (Bouncie)**; a driver can also use "**Broadcast my phone's GPS**" on their screen as a backup.

Questions or changes you can't make here (new manager codes, billing, the push notification keys / GPS setup) go to the owner.

Open / Close Checklist

Print this page. Tap through it at the start and end of every shift.

■ OPENING (start of service)

- [] Open nomansdrive.com/admin and log in (password Rumrunner2026).
- [] **Service status** → **Go online**.
- [] At least one driver shows **on shift** (Drivers section).
- [] Each driver has logged in and **picked their van** (■ Van 1 / Van 2).
- [] **Push alerts** are **on**.
- [] Each driver has tapped **Enable phone alerts** on their phone (iPhone: Add to Home Screen first) — Van 1's phone especially, since it gets pinged first.
- [] Tap **Send test push** — confirm drivers get it.
- [] Have each driver tap **Unlock** on their screen so the chime works.
- [] **Live GPS (Bouncie)** shows the van reporting in (or driver is broadcasting phone GPS).

■ CLOSING (end of night)

- [] All rides in the queue are **Finished** (queue is empty).
- [] **Service status** → **Take offline**.
- [] Flip any **on-shift** drivers **off** in the Drivers section.
- [] Glance at **Today's rides** for the night's count.

■ IF SOMETHING'S OFF

- **Guests can't request** → check **online** + they're inside the **service area**.
- **Driver gets no requests** → logged in, **picked a van**, and tapped **Enable phone alerts** (Van 1 gets new rides first; Van 2 only when Van 1 is busy).
- **No push** → **Push alerts on** + driver **on shift** + alerts enabled on their phone; try **Send test push**.
- **No chime** → driver taps **Unlock** once; test with **Driver chime test**.
- **Van missing from map** → check **Live GPS**, or driver turns on **Broadcast my phone's GPS**.

Anything you can't fix here → call the owner.
